REASON FOR VISIT: Routine 20-week anatomy ultrasound and obstetric consultation.

OBSTETRIC HISTORY: Patient is a 29-year-old primigravida at 20 weeks 3 days estimated gestational age calculated from an accurate first-trimester crown-rump length ultrasound.

COMPREHENSIVE FETAL ANATOMY SCAN:

Fetal Number and Lie: Single live intrauterine gestation in cephalic presentation. Active fetal somatic movement and normal cardiac activity demonstrated (fetal heart rate 144 beats per minute with regular rhythm).

Biometric Measurements:

- Biparietal Diameter (BPD): 48 mm (corresponds to 20w 4d)

- Head Circumference (HC): 178 mm (corresponds to 20w 2d)

- Abdominal Circumference (AC): 154 mm (corresponds to 20w 4d)

- Femur Length (FL): 33 mm (corresponds to 20w 3d)

- Estimated Fetal Weight (EFW): 358 grams (52nd percentile by Hadlock 4-parameter formula).

Anatomical Survey:

- Cranium and Brain: Intact cranium, normal cavum septi pellucidi, normal lateral ventricles (atria 6.2 mm, normal < 10 mm), intact cerebellar hemispheres with normal cisterna magna (5.4 mm).

- Face and Neck: Normal facial profile, orbits intact, bilateral nostrils, intact upper lip and palate without clefting. Normal nuchal fold thickness.

- Thorax: Normal symmetrical lungs without pleural effusions. Four-chamber cardiac view normal; left and right ventricular outflow tracts demonstrated with normal spatial crossover.

- Abdomen: Stomach bubble visualized in the left upper quadrant. Both kidneys visualized with normal renal pelves without pyelectasis. Intact anterior abdominal wall with normal three-vessel umbilical cord insertion.

- Spine and Extremities: Intact neural tube with skin covering over the lumbosacral spine. All four extremities visualize three segments with normal hands and feet.

Placenta and Amniotic Fluid: Placenta is posterior, grade I maturity, located 4.2 cm clear of the internal cervical os (no placenta previa). Amniotic fluid volume is normal with a single deepest vertical pocket (DVP) of 4.8 cm.

CLINICAL IMPRESSION:

1. Normal single intrauterine gestation at 20 weeks with unremarkable complete anatomical survey.

2. Routine follow-up scheduled in 4 weeks for antenatal check and 28-week gestational diabetes 1-hour glucose challenge screening.
